

CASE STUDY NOTES

Case Study 1: Airbnb

Company Name: Airbnb

Industry: Hospitality & Travel Technology

Airbnb uses Business Intelligence (BI) to understand customer preferences, booking patterns, and host performance across its global platform. The company collects and analyzes large volumes of booking and review data to identify trends in traveler behavior and accommodation demand. Key Performance Indicators (**KPIs**) tracked by Airbnb include occupancy rate, average booking value, guest ratings, review sentiment, and repeat booking frequency. These insights help the company improve its recommendation systems, optimize pricing strategies, and identify emerging travel destinations. The information generated through BI enables both Airbnb and its hosts to make data-driven decisions that enhance customer experience, increase bookings, and improve overall platform performance.

Case Study 2: Booking.com

Company Name: Booking.com

Industry: Online Travel & Hospitality

Booking.com utilizes Business Intelligence to analyze customer reviews, booking behavior, and accommodation performance across its platform. The company processes large amounts of user-generated feedback to understand factors that influence traveler satisfaction and booking decisions. Key Performance Indicators (KPIs) monitored by Booking.com include review scores, booking conversion rates, cancellation rates, customer satisfaction ratings, and accommodation performance metrics. The insights derived from this data help improve search rankings, personalize accommodation recommendations, and support hotel partners in enhancing their services. By leveraging BI, Booking.com is able to improve user experience, build customer trust, and facilitate more effective business decisions for accommodation providers.

Case Study 3: NotOnMap

Company Name: NotOnMap

Industry: Sustainable Tourism & Community-Based Homestays

NotOnMap is an Indian travel platform that connects travelers with local homestays and experiential tourism opportunities in rural and remote regions. The platform relies heavily on traveler feedback, host performance, booking trends, and experience ratings to understand visitor preferences and improve service quality. Key **KPIs** include guest satisfaction ratings, repeat bookings, review sentiment, host responsiveness, occupancy levels, and participation in local experiences. The insights generated from this data help identify which experiences are most valued by travelers, what concerns guests frequently raise, and how local hosts can improve their offerings. Business Intelligence supports better decision-making by enabling the platform to enhance traveler experiences while promoting sustainable tourism and generating economic opportunities for local communities.
